Yankee hoods upgrade

Argentinian leading packaging paper and tissue producer UnionPel selected Toscotec to supply a technological upgrade of PM1 at their Pacheco mill in the province of Buenos Aires. This new order involves an upgrade of the existing hybrid system configuration, where heated air is blown on the paper in the wet-end and only extraction is applied in the dry end. In order to increase PM1's drying capacity, Toscotec will install a TT Hood-Duo system with two separate circuits of heated air, one to the wet end hood and the other to the dry end. The new air system configuration will achieve a 20% production increase. Toscotec will also install TT Swing, an energy-efficient solution that according to the production requirements, regulates the air system operation mode to deliver flexibility and energy saving in the drying section of the tissue machine.
