JK Paper acquires BTG Particle Charge Detector

JK Papers has acquired BTG PCD-06, a laboratory device which permits to determine the amount of charged substances in aqueous samples. Eventually, the PCD-06 helps paper-makers defining the exact demand for chemical additives, allowing a responsible usage of resources - which saves cost and prevents process inefficiency. This version is available on the market for less than 2 years. With its decision to use PCD-06 in its 200'000 TPA multi-layer board machine, JK Paper demonstrates once more its commitment to high quality standards, thanks to an optimization of the chemistry on the wet-end.
